When the Heartland Expressway is completed, it will offer vacationers a corridor of geologic wonders from Denver to Rapid City, S.D.

By James P. Salen

The Heartland Expressway, the 3,000-mile route involving a proposed four-lane divided highway in Nebraska, South Dakota, Wyoming, and Colorado, will be a geologic treasure trove, according to geologists working on the project. The Heartland Expressway is designed to provide a scenic route that passes through some of the most beautiful and diverse landscapes in the United States. The route will feature breathtaking views, including rolling hills, rocky canyons, and vast plains. The geologic diversity of the region will be on display, providing a unique opportunity for travelers to explore the region's geological history. The route will also feature numerous geologic wonders, including ancient river beds, fossil deposits, and mineral deposits. The Heartland Expressway is expected to be completed in 2024.
